

Odyssey Mission Technical Digest: Dual-System Summary

COLUMN 1: ROVER EXPLORATION

The Martian rover Odyssey traversed 14 kilometers across the crater floor.

Soil samples revealed magnesium sulfate deposits and hydrated silica beds.

Wheels exhibited minor abrasive wear on the titanium grousers, but torque margins remained above 85 percent.

Autonomous hazard avoidance engaged twelve times to navigate steep dunes.

COLUMN 2: NUCLEAR REACTOR

Primary Stirling reactor unit Beta generated 9.8 kilowatts electrical.

Sodium coolant core temperature stabilized at 680 Kelvin nominal.

Radiation perimeter sensors recorded under 0.04 millisieverts per sol.

Backup control rods demonstrated full insertion capability in 1.2s.

Continuous power delivery was verified.
