

Extraterrestrial Medical Emergency & Hypobaric Decompression Guidelines

1. Acute Decompression Sickness (DCS)

DCS protocols require immediate crew placement into the 2.8 ATA hyperbaric treatment lock, administering 100 percent humidified normothermic oxygen for a 120-minute cycle.

2. Microgravity Fracture Stabilization

Long-bone fractures are stabilized with lightweight carbon-fiber external fixator splints and ultrasound bone-growth stimulation to counter microgravity osteopenia.

3. Telemedicine Diagnostic Ultrasound

Autonomous ultrasound scanning with real-time Earth surgical teleconsultation guides thoracic cavity needle decompressions in suspected pneumothorax incidents.
